

## CANDY ONION

Hardy plants will produce sweet yellow onions that can potentially be 6" wide. Candy onion plants are easy to grow due to their strong root system and disease resistance.

They're great eaten raw, on sandwiches, lightly cooked in salsas and stir-fries, and cooked into meat dishes, casseroles and other recipes. It's also a fairly good storage variety.

Day-neutral onions, like Candy Hybrid, begin forming bulbs when daylight lasts 12-14 hours, making them well adapted to Ohio.

## PATTERSON ONION

Patterson onions are a long-day variety of yellow onion that produce firm, globe-shaped bulbs and may get 3.5–4 inches in size. They have a moderate pungency and good sugar content.

Patterson onions can store for 10–12 months in a cool, dark location, and maintain their quality long after other varieties have gone soft.
